← Index

Build five simulated students. Then catch your chatbot marking them wrong.

Work in pairs with any free web chatbot (ChatGPT, Claude, Gemini, Copilot). Pick a subject you actually teach. You'll see adaptive drift with your own eyes, then try one fix.

15:00 Start Reset

1 Set up your task

2 min

Pick a subject, or write your own task. The page turns what you type into ready-to-paste prompts.

Maker
Holds this page. Runs the twin generator and knows the secret skill levels.

Judge
Uses a separate chat window. Never sees the levels. Marks the answers. Working alone? Use two chats and look away from the levels.

Subject

Argumentative writing (humanities, social science)

Task the students answer

Should cities ban private cars from their centres? Write a short argument.

Answer length (words)

100

Skills you would mark (the rubric)

Skill 1

Clear claim

states a specific, arguable position in the opening sentence

vague or purely descriptive, takes no position

Skill 2

Use of evidence

gives at least one concrete example, fact or figure that supports the claim

makes assertions with nothing behind them, or says "studies show" with no detail

Skill 3

Counterargument

names an opposing view and answers it

ignores other views, or attacks a weak version of them

Add a skill | Remove last skill

2 Maker: make five twins

3 min

The page has dealt each twin a secret level (0–100) for every skill in your rubric, so a twin can be strong on one skill and weak on another. The overall level is the average. Two twins sit close to the pass mark of 50, because that's where drift hurts most. Paste the prompt into a fresh chat.

P	Q	R
??	??	??
S	**T**	
??	??	

Show levels (Maker only)

```
I am testing an assessment. Act as five different students
answering the same task.

Subject: Argumentative writing
Task given to students: Should cities ban private cars from their
centres? Write a short argument.
Length: about 100 words per answer.

Each student has a level from 0 (no understanding) to 100 (excellent) on
each of 3 skills. Levels differ by skill, so a student can be strong on
one and weak on another:
Student P: Clear claim 56, Use of evidence 56, Counterargument 23
Student Q: Clear claim 66, Use of evidence 49, Counterargument 49
Student R: Clear claim 35, Use of evidence 17, Counterargument 38
```

Copy

Paste the five answers the chatbot wrote

Student P: ...
Student Q: ...

Check the chatbot kept the labels P–T and left the levels out of the text. Send only the answers to the Judge.

3 Judge: mark them cold

3 min

In a **new chat**, paste this prompt. The Judge has never seen the levels, which is exactly how a real assessment bot works.

```
You are a teacher marking student work.

Subject: Argumentative writing
Task given to students: Should cities ban private cars from their centres?
Write a short argument.
```

Copy

```
Score each answer from 0 to 100 for overall quality. Reply with a table:
Student | Score | One-sentence reason.

[PASTE THE FIVE ANSWERS HERE]
```

Predict first. The weakest student (the one with the lowest level) will be scored:

◯ within 10 points of their real level or below ◯ more than 10 points above

Enter the scores the chatbot gave

Student P

Student Q

Student R

Student S

Student T
